Introduction

More than 600 databases are available on the *Dialog* service. Each database is a compilation of authoritative data provided by the most reputable publishers, professional societies, scientific organizations, and Thomson. The breadth and depth of information on *Dialog* guarantees you will find relevant information for almost any topic imaginable.

This *Database Selection Guide* is intended to

- > help you identify *Dialog* databases that are relevant to a particular research topic
- > illustrate how to use the time-saving, pre-selected subject groupings of databases known as OneSearch categories
- > introduce the Alias feature, a tool for creating your own, customized OneSearch categories
- > provide step-by-step instructions for using the DIALINDEX finding tool in Dialog Command Language (*DialogClassic*) and *DialogLink 5*

About Dialog

Dialog is the premier online retrieval service with the most comprehensive content collection and most powerful search language available. From concept testing, to clinical trials, to product launches, to patent protection, *Dialog* delivers accurate, relevant, trustworthy results with amazing speed. Choose web, text or customized interfaces, or integrate just the content you need into your own applications. Thomson Scientific has developed a comprehensive suite of online search tools for *Dialog* to fit the needs of any researcher or information user, regardless of research focus, skill level or preferred interface. Combining flexible pricing options and up-to-date Web Services tools, you can also create your own content set and interface derived from the entire *Dialog* collection.

Integrate content with Web Tools for Dialog

Content can be integrated into portals and other tools using the *Dialog* Application Programming Interface (*Dialog API*), an XML-based web service that enables *Dialog's* extensive content collection and renowned search engine to be integrated transparently into websites, enterprise portals, corporate intranets and extranets, software applications and other interactive services. *Dialog API* supports Web Services Description Language (WSDL) and Simple Object Access Protocol (SOAP) for integrating *Dialog* content into compatible platforms.

Applications created using the *Dialog API* can utilize the entire *Dialog* content set, enabling the creation of comprehensive information solutions. And, since the *Dialog API* interfaces with the powerful *Dialog* search engine, applications can be created for novice users and expert searchers alike.

Let Thomson Scientific handle your research needs

If you are short on time, staff or expertise in a subject area, the Search Services professionals from Thomson Scientific can help. We understand the art of patent, literature, competitive intelligence and market data searching and possess the breadth and depth of knowledge necessary to fulfill your requests, on time and within budget. We can provide research assistance in many areas, including:

- > Clearance / Right-to-Use / Freedom-to-Operate Searching
- > Collection / State-of-the-Art Searching
- > Competitive / Technical Intelligence Searching

Introduction

- > Infringement Searching
- > Novelty / Patentability / Prior Art Searching
- > Patent Watches and Alerts
- > Validity / Invalidity Searching

Our team of advanced-degree specialists has extensive knowledge of business methods, chemicals, intellectual property, mechanics, pharmaceuticals, science and more.

Knowledgeable, global customer support

In addition to sophisticated precision tools and accurate, authoritative content, Thomson Scientific solutions are supported by best-in-class customer service and training. Highly skilled and knowledgeable consultants from a wide variety of educational and professional backgrounds staff our worldwide Knowledge Center, 24 hours a day, every business day.

As an extension of your organization, the Knowledge Center offers peer support through specialists with backgrounds as librarians, IT specialists, scientists, attorneys and business professionals. Combine our Knowledge Center search and product expertise with your own knowledge and understanding of your research needs for the optimal search outcomes.

For more information, go to **support.dialog.com**, email **dialogcustomer@thomson.com** or call +1 800 334 2564 (inside North America) or 00 800 33 34 2564 (outside North America).

Dialog Databases

A *database* or *file* is a collection of information on a particular subject and contains a number of separate documents all with the same structure. Each database on *Dialog* is identified by a number (e.g., U.S. Patents Fulltext is "File 654"). The content in a database may be an online version of something previously published in print, entirely new material or a compilation of information appearing in many different publications. Databases are sometimes divided up into several file segments. Each *file segment*, most commonly divided by dates of coverage, contains a different piece of the database. An example is EMBASE®: File 72 covers 1993 to the present; File 73 covers 1974 to the present; File 772 covers 1947 to 1973. Available databases are described more fully in the *Dialog • DataStar Database Catalog*.

Kinds of databases

Each unit in a database is referred to as a *record* or *document*. Exactly what makes up a record differs from database to database. There are four general types of databases: Bibliographic, Numeric, Directories and Complete text.

- > **Bibliographic databases.** Each record in a bibliographic database is a reference or citation (many also include a summary or an abstract) to a publication, magazine or journal article, news story, patent, conference paper, etc. (e.g., MEDLINE® [File 154], Inspec® [File 2], *Derwent World Patents Index*® [File 351]).
- > **Numeric databases.** Each record in a numeric database is a table of statistical data, often with text added (e.g., TableBase™ [File 93]).
- > **Directory databases.** Each record gives factual information about companies, organizations, products, chemical compounds, etc. (e.g., D&B—European Financial Records [File 523], TRADEMARKSCAN®—U.S. State [File 246], Merck Index OnlineSM [File 304]).
- > **Complete text databases.** Each record includes the complete text of magazine articles, newswire stories, patents, etc. (e.g., *The San Jose Mercury News* [File 634], U.S. Patents Fulltext [File 654]).

In addition, some databases contain a mix of several different kinds of data, such as bibliographic and fulltext records (e.g., Business & Industry™ [File 9] and Gale Group PROMT® [File 16]); graphics (e.g., chemical structures in Beilstein Database—Facts [File 390], drawings in *Derwent World Patents Index*® [File 351]); and links to original source documents (e.g., in Frost & Sullivan Market Engineering [File 767]).

Database updates

Databases are updated regularly, usually according to a fixed schedule, such as daily, weekly or monthly. Some databases are updated annually, or whenever there is a new version produced. Update frequencies are sometimes different from when articles appear in print versus online. A database noted as having an Update Frequency of "Archive" contains backfiles covering a specific time period. Current updates are added to a different file segment. For example, Dialog NewsRoom (NE04) is listed as "Archive" with data from 2004. Other databases are listed as "Closed" in that they contain a finite time period and are no longer updating.

Most databases update cumulatively, that is new records are added to the existing contents of the database. News databases are common examples of cumulative updates. Updates to some databases, however, replace some or all of the database contents. Company and other types of directories are examples of replacement updates.

Dialog Databases

A few databases are *reloaded* on a regular basis. A database reload means that the entire contents of the database are replaced with revised content. MEDLINE® is a database that is reloaded each year to reflect revised medical terminology applied by the National Library of Medicine to all the records in the database.

Database sources

Dialog databases come from many sources, including publishers, professional societies, research centers, government agencies, and from sources within Thomson. Thomson Scientific licenses the data from these providers for redistribution through its online services. The copyright usually belongs to the provider, and each provider may impose some conditions for how their data is used. For this reason, some data may be available only via an annual subscription (e.g., Elsevier's EMBASE Classic [File 772]) or may be available in certain geographic areas (e.g., the U.S. Government's World News Connection [File 985]).

Choosing the right database

The success of an online search depends in large part on the database(s) chosen. The following Database Selection Checklist will help you in determining the appropriate database.

- > What is the general subject? (e.g., business, science, environmental, etc.)
- > What is the perspective of the question? (e.g., technical, consumer-oriented, academic, etc.)
- > How much information is desirable? (e.g., overview, comprehensive, etc.)
- > What type of database is needed? (e.g., directory, complete text, etc.)

Several tools are available to help you identify the best database(s) for your research, including this *Guide*. In particular, DIALINDEX is highly recommended as the best online tool for discerning the most relevant databases for a given topic. Additional online and print tools are available and are described in the *Dialog Command Language Pocket Guide*.

Dialog Bluesheets

While many databases are focused on similar subjects, each database is unique. Differences may result from types of publications covered, data included, indexing standards, the presence of a thesaurus, or special formatting options. Details of each database are documented in its *Bluesheet*. A *Dialog* Bluesheet contains a description of the database content, provider contact information, terms of use, specific data available for searching, tagging, output formats, and other important features specific to the database. Bluesheets are available in PDF format online at library.dialog.com, or as searchable text online in *Dialog* File 415.

Dialog OneSearch: Database Subject Categories

Databases with related content are grouped into predefined subject categories and given a four- to eight-character identifier. The identifier, or *OneSearch category*, may then be used in *Dialog* Command Language searches as a shortcut to open all of the databases in the OneSearch category with a single BEGIN command. Any search entered will execute in all of the databases in the category. The OneSearch categories may also be used with the DIALINDEX finding tool. See the DIALINDEX section for more details.

The list below includes most of the available OneSearch categories. You are not limited to these categories: use SET ALIAS to create your own database groups. SET ALIAS is explained and illustrated on page 12.

Dialog OneSearch Categories

The titles or names of *Dialog* OneSearch categories appear below in alphabetical order followed by its OneSearch category identifier or mnemonic. Use the identifier as a shortcut rather than individual file numbers. Variant names for the same category are included in the list. The list of databases included in OneSearch Categories may be found in the expanded list of Categories beginning on page 23.

Dialog OneSearch Categories by Topic

OneSearch categories are listed below by topic in alphabetical order.

Dialog OneSearch: Database Subject Categories

Create your own Dialog OneSearch Category with Alias

If you have identified a set of databases that meet your needs, you can define your OneSearch category by creating an Alias. The Alias must be a single alphanumeric word, up to 15 characters in length. You may then save your new Category to your account profile in order to make it a permanent part of your *Dialog* account. The methods for creating an Alias in Dialog Command Language (*DialogWeb—Command*, *DialogClassic Web*) and *DialogLink 5* are illustrated below. In the examples, a new OneSearch category name — an Alias — is created for the biomedical databases MEDLINE®, EMBASE®, BIOSIS® and SciSearch®. The database numbers are 154, 73, 5, 434, respectively, and “meddbs” is the name assigned to the Alias.

Dialog Command Language: SET ALIAS Command

If using the *DialogClassic Web* or *DialogWeb—Command* interface, the command format is as follows:

Command	Alias	File Numbers
set alias	meddbs	154,73,5,434

When connected to the *Dialog* service, enter:

```
?set alias meddbs 154,73,5,434  
[system response] meddbs is set On as an alias for 154,73,5,434
```

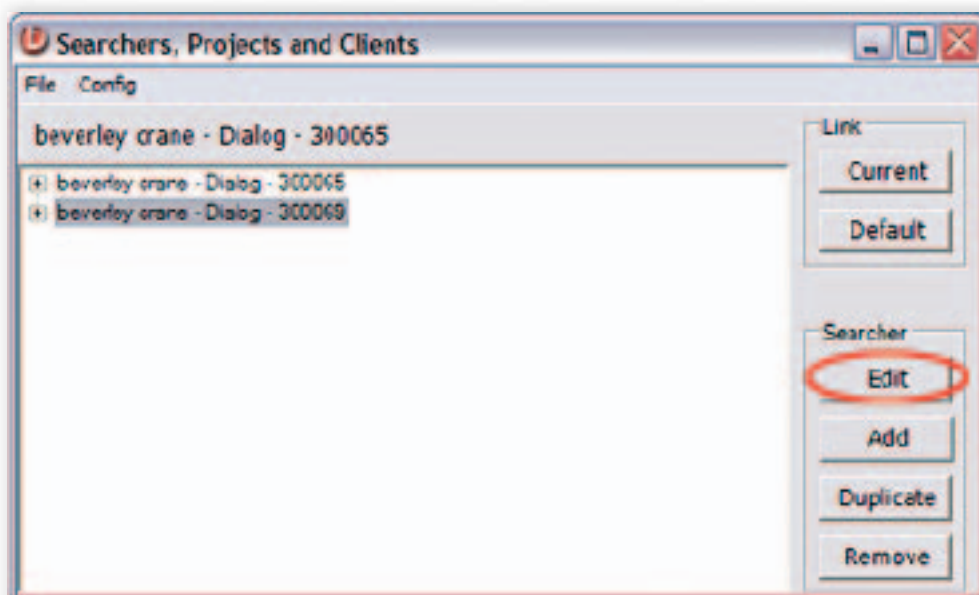

To use all the databases in a search, enter:

```
?begin meddbs
```

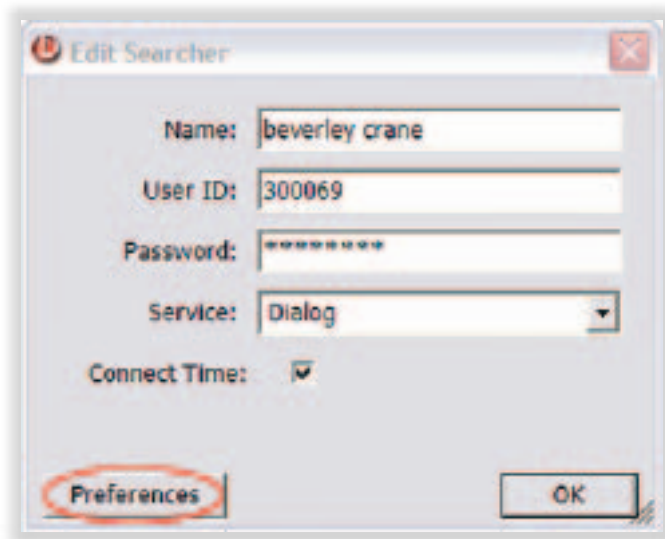

DialogLink 5: Searcher Preferences - Alias

To Create an Alias in *DialogLink 5* and save it to your account

- 1 From the menu bar, click **Configuration > Settings**. On the Searchers, Projects and Clients screen, click the user ID where you want to set the Alias and click **Edit** under Searcher.

- 2 From the Edit Searcher screen, click the Preferences button at the bottom of the screen to change preferences for this user ID.

Edit Searcher

Dialog OneSearch: Database Subject Categories

4 On the Set Preferences screen, enter the Alias Name (**meddbs**) and "Values", i.e., the database numbers that you want to search with this Alias (154, 73, 5, 434); then click **OK**.

5 Finally, exit the Configuration menu by clicking **OK** back through the screens above.

Database Finding Tools: DIALINDEX®

DIALINDEX (File 411) is a unique database that contains in a single file the indexing for most of the databases on *Dialog*. By entering a search query in DIALINDEX, the *Dialog* system will report how many matching records or “hits” are found, and in which databases. DIALINDEX is a tool for determining which databases have relevant content based on your search query. Using DIALINDEX before conducting a database search you can

- > be certain which databases have relevant content
- > choose only the database(s) that have the most coverage for your topic
- > avoid wasted time searching irrelevant databases
- > scan the *Dialog* collection when the topic is obscure or does not fit into a well-defined subject area
- > refine your search strategy by testing and comparing the number of hits

When you’re not sure which database(s) might have the most data on your topic, use DIALINDEX as the first step in your online research. You can scan several databases, a OneSearch category of databases, or create your own category using the Alias feature, or use a “Supercategory” unique to DIALINDEX. An example of a Supercategory is ALL which is used to scan every database on the *Dialog* service. Available Supercategories are listed on page 22.

It is important to note that DIALINDEX does not actually retrieve the records resulting from the search. You must BEGIN the desired databases to retrieve and view the results.

Once you have identified the relevant database(s), use OneSearch to conduct a comprehensive search in those files. In OneSearch you can search up to 60 databases, browse the indexes using the EXPAND command, display records, or use any of the available system features, such as Duplicate Detection and RANK. For more information on using OneSearch or DIALINDEX, refer to the *Dialog Pocket Guide*, online at support.dialog.com/searchaids/dialog/pocketguide.

Step-by-step examples of complete search sessions using DIALINDEX appear below. The first example illustrates DIALINDEX using Dialog Command Language (*DialogWeb—Command*, *DialogClassic Web*). The second example illustrates DIALINDEX on *DialogLink 5*.

Database Finding Tools: DIALINDEX®

Dialog Command Language: DIALINDEX Sample Search

The search illustrated below shows how to start your search in DIALINDEX using *Dialog* Command Language, select relevant databases, then carry the search into the selected databases, remove any duplicate records, then display the results.

Topic: Use DIALINDEX to locate the best databases in which to research the uses of adenovirus in gene therapy to treat cystic fibrosis.

BEGIN (B) DIALINDEX.

```
?b 411

File 411:DIALINDEX(R)
DIALINDEX(R)
(c) 2007 Dialog

*** DIALINDEX search results display in an abbreviated ***
*** format unless you enter the SET DETAIL ON command. ***
```

Use the SET FILES (SF) command to select a category of databases to scan, in this case the MEDICINE OneSearch category.

```
?sf medicine

You have 26 files in your file list.
(To see banners, use SHOW FILES command)
```

Enter search terms in one SELECT (S) statement.

```
?s cystic(w)fibrosis/ti,de and gene(w)therapy and adenovirus?
and py>2006

Your SELECT statement is:
S CYSTIC(W)FIBROSIS/TI,DE AND GENE(W)THERAPY AND
ADENOVIRUS? AND PY>2006

Items  File
-----  ----
1      5: Biosis Previews(R)_1926-2007/Sep W4
2      34: SCISEARCH(R) CITED REF SCI_1990-2007
2      45: EMCare_2007/Sep W4
14     73: EMBASE_1974-2007/Oct 01
1     155: MEDLINE(R)_1950-2007/Sep 27
>>>Term "DE" is not defined in file 172 and is ignored
1     172: EMBASE Alert_2007/Sep 24

Geographic Location: England

Journal Subject Category: MEDICINE, GENERAL & INTERNAL

Abstract: Background

Cystic fibrosis is caused by a defective gene encoding a protein called the cystic fibrosis transmembrane conductance regulator (CFTR), and is characterised by chronic lung infection resulting in inflammation and progressive lung damage that results in a reduced life expectancy.

.

Main results

Three randomised controlled trials met the inclusion criteria for this review, involving a total of 155 participants. Thirteen studies were excluded. The included studies differed in terms of CFTR gene replacement agent and study design, which limited the meta-analysis.

Authors' conclusions

There is currently no evidence to support the use of CFTR gene transfer reagents as a treatment for lung disease in people with cystic fibrosis. Future studies need to investigate clinically important outcome measures.

Identifiers-- KeyWord Plus(R): PLACEBO-CONTROLLED TRIAL; NASAL EPITHELIUM; MAXILLARY SINUS; DOUBLE-BLIND; RECOMBINANT **ADENOVIRUS**; BIOLOGICAL EFFICACY; CLINICAL-TRIALS; CFTR MUTATIONS; AAV-CFTR; PHASE-I

Database Finding Tools: DIALINDEX®

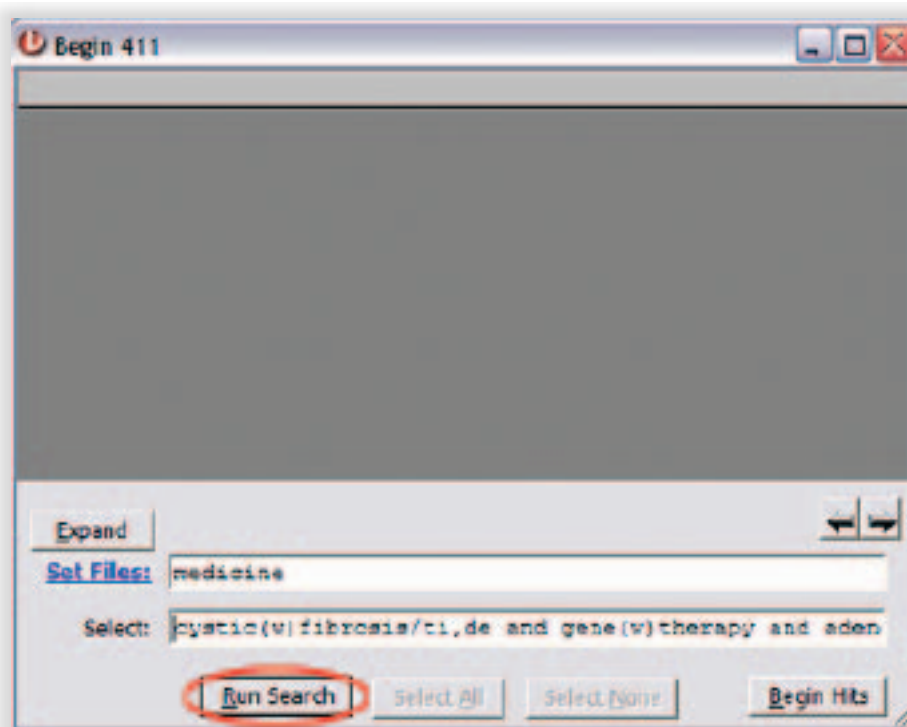

DialogLink 5: DIALINDEX Sample Search

The search illustrated below shows how to start your search in DIALINDEX using *DialogLink 5*, select relevant databases, then carry the search into the selected database, remove any duplicate records, then display the results.

Topic: Use DIALINDEX to locate the best databases in which to research the uses of adenovirus in gene therapy to treat cystic fibrosis.

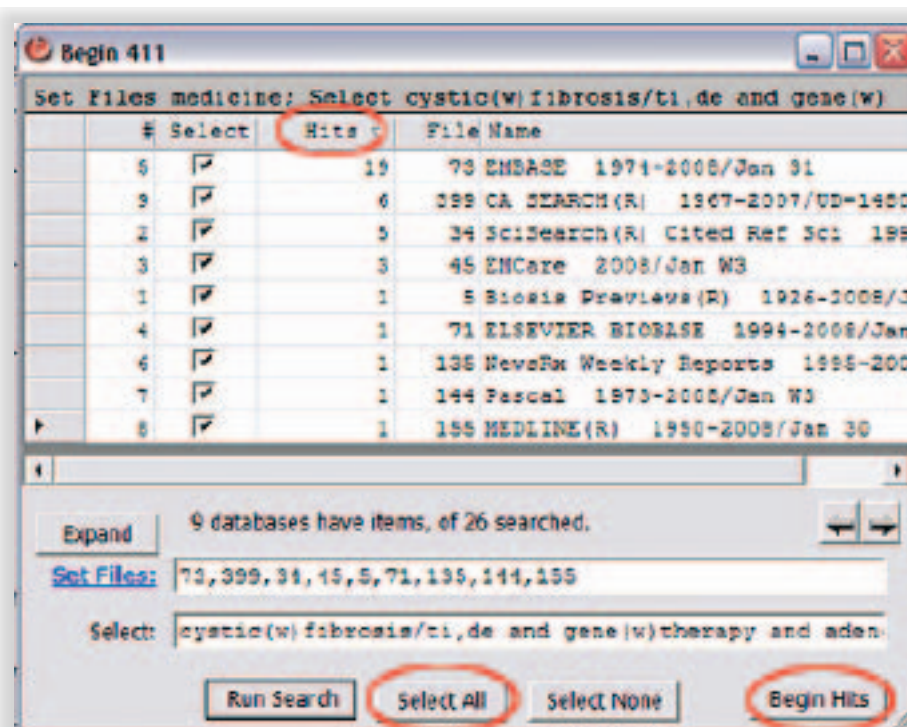

To begin your DIALINDEX search, enter B 411 in the Type-Ahead Buffer at the bottom of the screen. The Begin 411 screen displays as shown.

Enter the category you want to search (e.g., MEDICINE) in the Set Files box. Enter your search strategy in one statement in the Select box and click the **Run Search** button.

A list displays of the databases with "hits" and the number of records in each containing your search strategy. To sort the list with the greatest number of records at the top of the list, click the **Hits** column header twice.

Next, click **Select All** to search all databases with records on the topic or check specific databases you want to search. Then click **Begin Hits** to search all checked. Your search is automatically executed in the databases you chose.

The resulting set (S1) shows 23 records were retrieved. Use the REMOVE DUPLICATES (RD) command to remove duplicate records before viewing them.

```

TYPE out one or two records FROM EACH database using Format 8 to see the title and descriptors and the KWIC (K) format to see keywords in the context of the articles.

Note: Some databases may not have a KWIC format. Review the records and either click **Links** at the top of the record of choice > **Display > Type Full Record** or use the TYPE command and Format 9 to see the complete record.

TEXT: 7 NOV 12 - ( & NewsRx.net) -- New investigation results.
'Activation of GTR-specific T Cells in cystic fibrosis mice following gene
transfer,' are detailed in a study published in
Molecular Therapy (see also ). "Gene therapy for cystic fibrosis (CF)
airway disease has emerged as a potentially successful therapy, because
expression of the CF gene would be expected to restore the
electrophysiological function of the airway epithelium to normalcy.
    
```

DIALINDEX Supercategories

DIALINDEX provides "Supercategories" that include hundreds of databases covering broad subject areas. The Supercategories may be used only in DIALINDEX; they are not available as OneSearch categories.

Dialog OneSearch/DIALINDEX Categories

In this section, OneSearch categories appear below with an enumeration of databases included in that category. Arrangement is by topic in "natural language." Next to each topic is the OneSearch category name or mnemonic. See page 7 for a summary list of category topics and names.

Cross-references have been added for convenience. **Please note that all categories may also be used with the DIALINDEX database finding tool.**

About Dialog

A pioneer in electronic information retrieval, Dialog is the global leader in providing mission critical information for research needs in science, engineering, business and intellectual property.

The online services provided by Dialog — offered through the Dialog® and DataStar® brands — give users the ability to search through more than 1.5 billion unique records from the world's most authoritative publishers. Sources include in-depth repositories of scientific, technical and biomedical data, patents and trademarks, and thousands of industry, news and company information sources. Librarians, researchers and information users from corporate, professional and government organizations in more than 100 countries prize Dialog for depth of content, precision searching and the ability to provide complete solutions.
